

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

Assessing the role of structurally complex forests as climatic refugia for plant biodiversity

Georg J. A. Hähn

Supervisor: Francesco M. Sabatini

Co-supervisor: Alessandro Chiarucci

Department of Biological, Geological, and Environmental Sciences

Introduction: Microclimate

Introduction: Microclimate

Introduction: Microclimate

Introduction: Microclimate

Chapter 1: *Protecting Old-Growth Forests for Biodiversity Conservation amid Climate Change.*

Georg J. A. Hähn, Helge Bruelheide, Alessandro Chiarucci, Michele Di Musciano, Borja Jimenez Alfaro, Tobias Kummerle & Francesco M. Sabatini (*in preparation*)

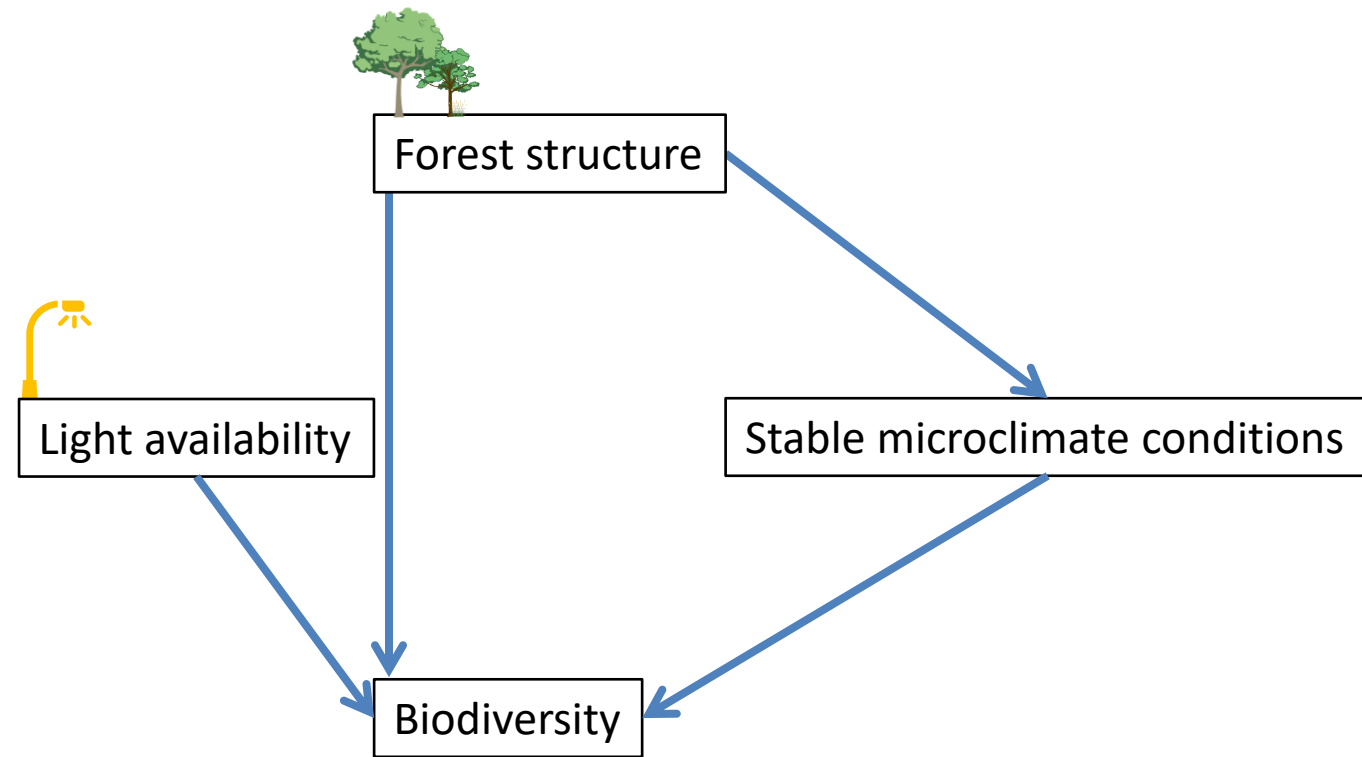

Revised publications: >100, between 1995 and 2024

Chapter 1: Protecting Old-Growth Forests for Biodiversity Conservation amid Climate Change.

Georg J. A. Hähn, Helge Bruelheide, Alessandro Chiarucci, Michele Di Musciano, Borja Jimenez Alfaro, Tobias Kummerle & Francesco M. Sabatini (*in preparation*)

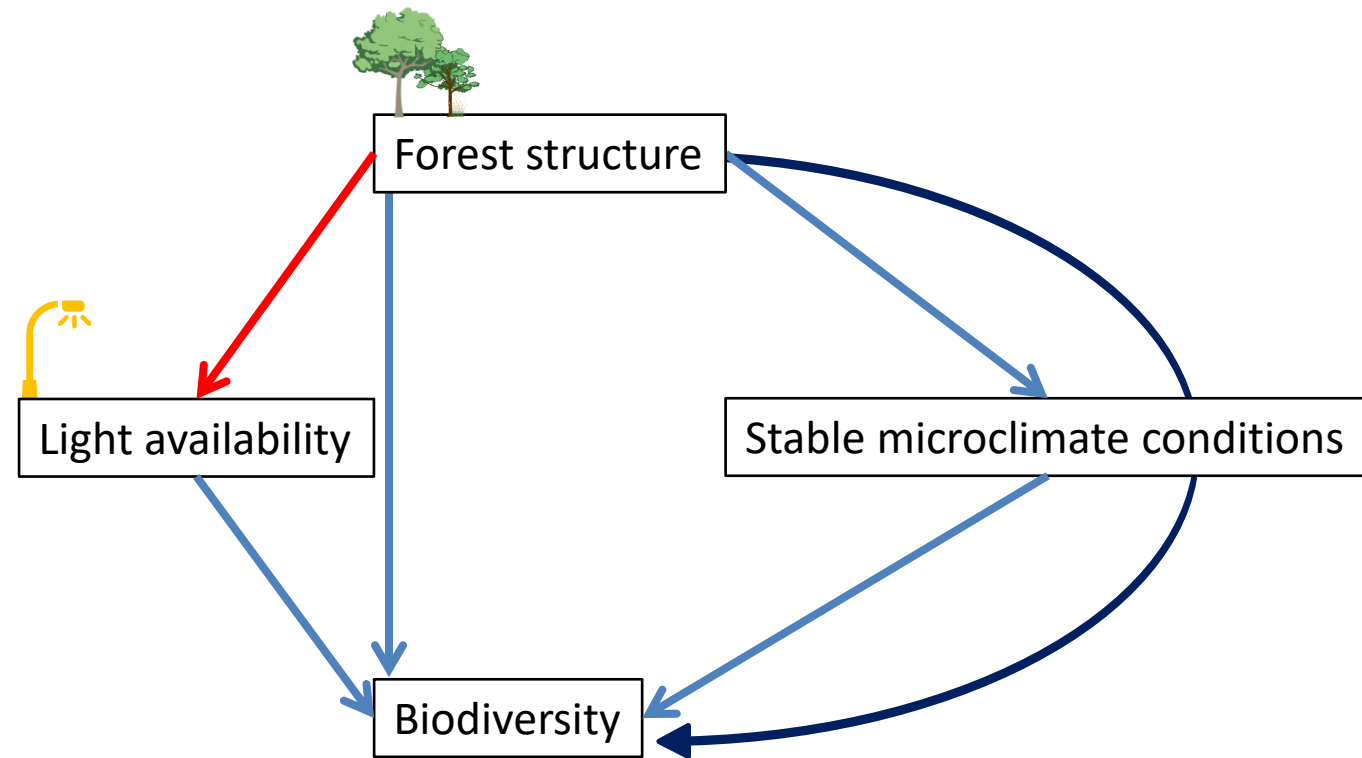

Revised publications: >100, between 1995 and 2024

Chapter 1: Protecting Old-Growth Forests for Biodiversity Conservation amid Climate Change.

Georg J. A. Hähn, Helge Bruelheide, Alessandro Chiarucci, Michele Di Musciano, Borja Jimenez Alfaro, Tobias Kümmerle & Francesco M. Sabatini (*in preparation*)

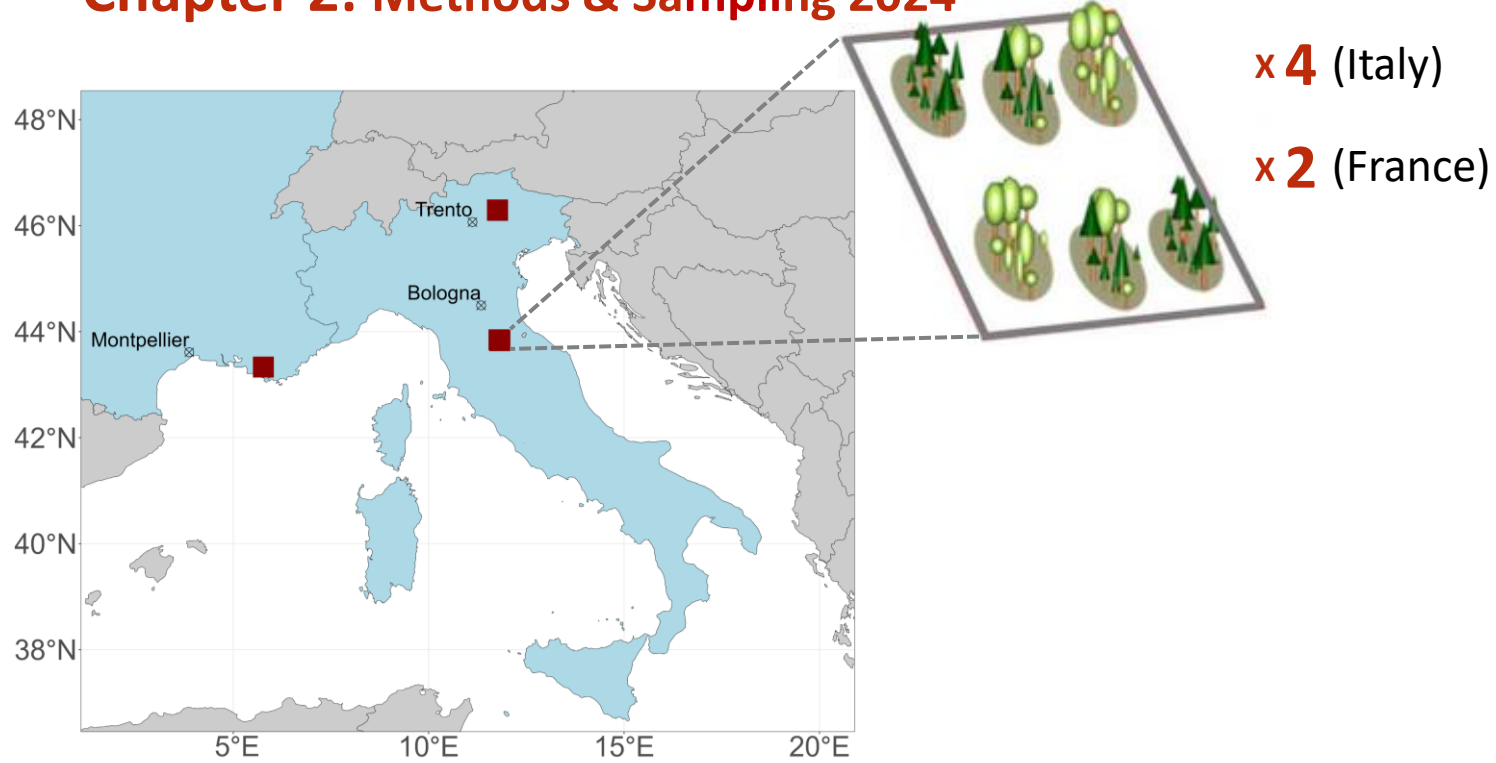

Revised publications: >100, between 1995 and 2024

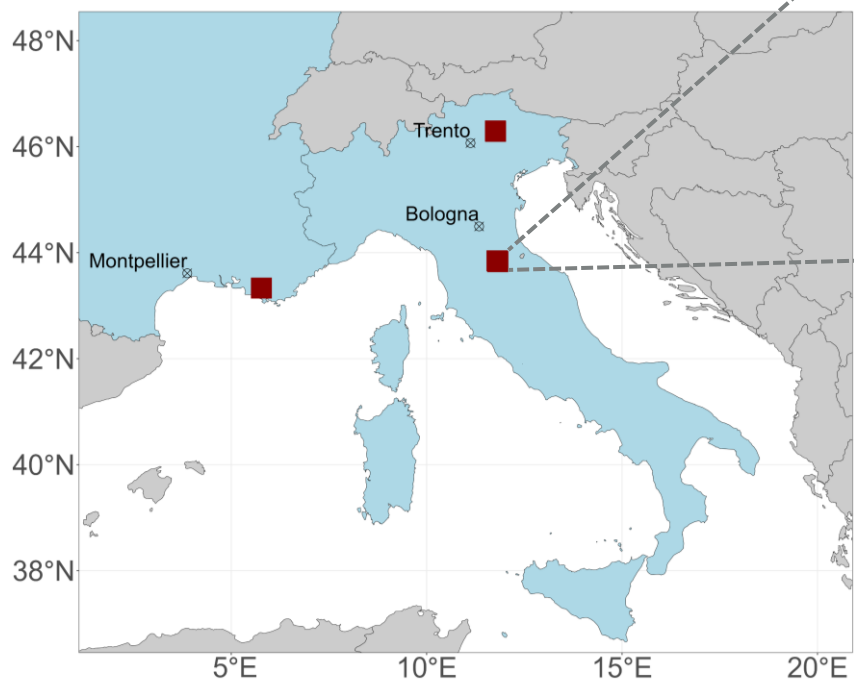

Chapter 2: Methods & Sampling 2024

Chapter 2: Methods & Sampling 2024

Chapter 2: Methods & Sampling 2024

x 4 (Italy)

x 2 (France)

= 48 (Italy) + **12** (France)

= 60 Vegetation plots
(5m x 5m)

Chapter 2: Methods & Sampling 2024

x 4 (Italy)

x 2 (France)

= 48 (Italy) + 12 (France)
= 60 Vegetation plots
(5m x 5m)

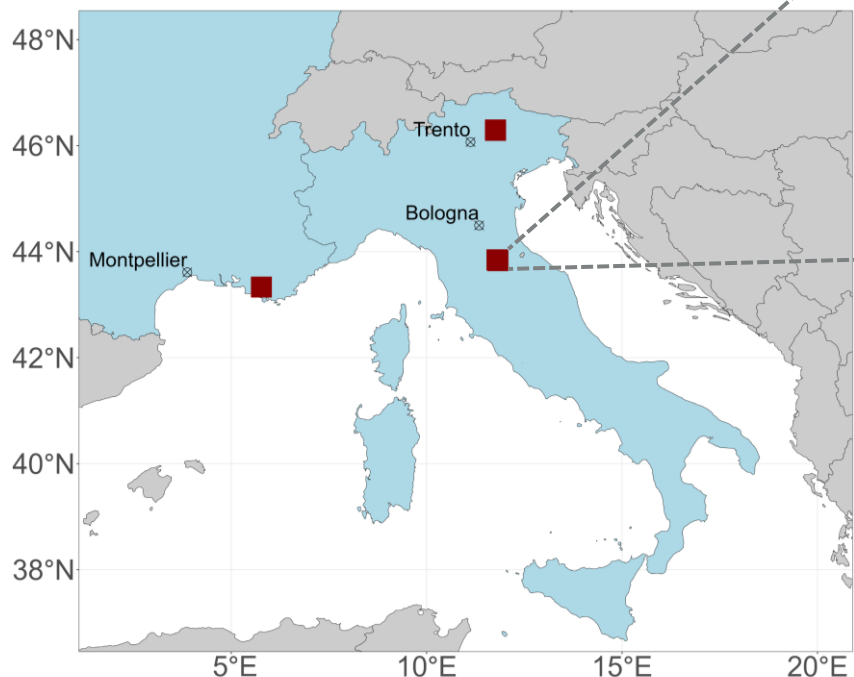

TMS logger in Sasso Fratino

Explanatory variables:

- Microclimate Temperature/Moisture Sensor (TMS) in the centre
- Terrestrial Laser Scan 1.5m above TMS → Stand Structural Complexity
- Tree diameter → stand biomass
- Hemispherical Densiometer → light availability

Chapter 2: Methods & Sampling 2024

x 4 (Italy)

x 2 (France)

= 48 (Italy) + 12 (France)

= 60 Vegetation plots
(5m x 5m)

Explanatory variables:

- Microclimate Temperature/Moisture Sensor (TMS) in the centre
- Terrestrial Laser Scan 1.5m above TMS → Stand Structural Complexity
- Tree diameter → stand biomass
- Hemispherical Densiometer → light availability

Response variables:

- Understorey vegetation survey, i.e., species richness, species diversity

TMS logger in Sasso Fratino

Understorey species cover estimation in Paneveggio

Chapter 2: Methods & Sampling 2024

Structural measurements of forests in three (simple)* steps:

Chapter 2: Methods & Sampling 2024

Structural measurements of forests in three (simple)* steps:

Set up a terrestrial laser scanner

Chapter 2: Methods & Sampling 2024

Structural measurements of forests in three (simple)* steps:

Set up a terrestrial laser scanner

Send your colleagues away

Chapter 2: Methods & Sampling 2024

Structural measurements of forests in three (simple)* steps:

Set up a terrestrial laser scanner

Send your colleagues away

Wait 10 minutes and measure some trees in the next plot

Chapter 2: Methods & Sampling 2024

Structural measurements of forests in three (simple)* steps:

Set up a terrestrial laser scanner

Send your colleagues away

Wait 10 minutes and measure some trees in the next plot

Result of the Terrestrial Laser Scan:

Stand structural complexity (SSCI):

$$SSCI = MeanFrac^{\ln(ENL)}$$

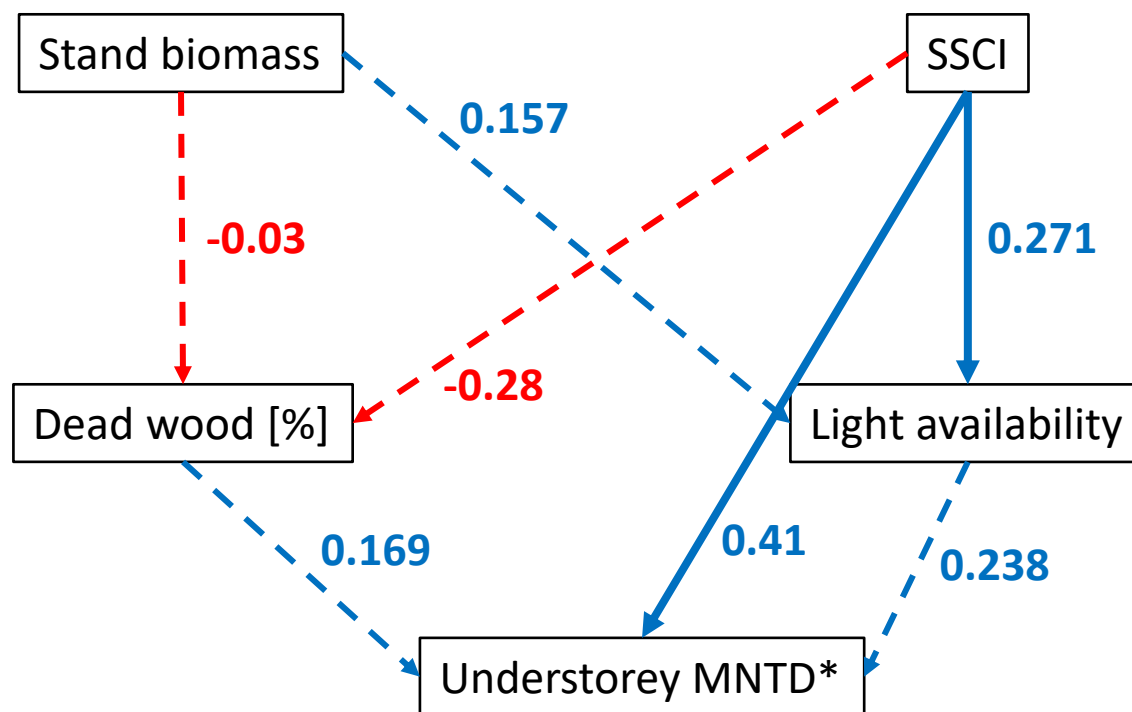

$$= Stand\ density^{\ln(Stand\ vertical\ structure)}$$

Chapter 2: Preliminary results

Chapter 2: Preliminary results

*Mean nearest taxon distance; how close the community is phylogenetically related

Outlook 2025

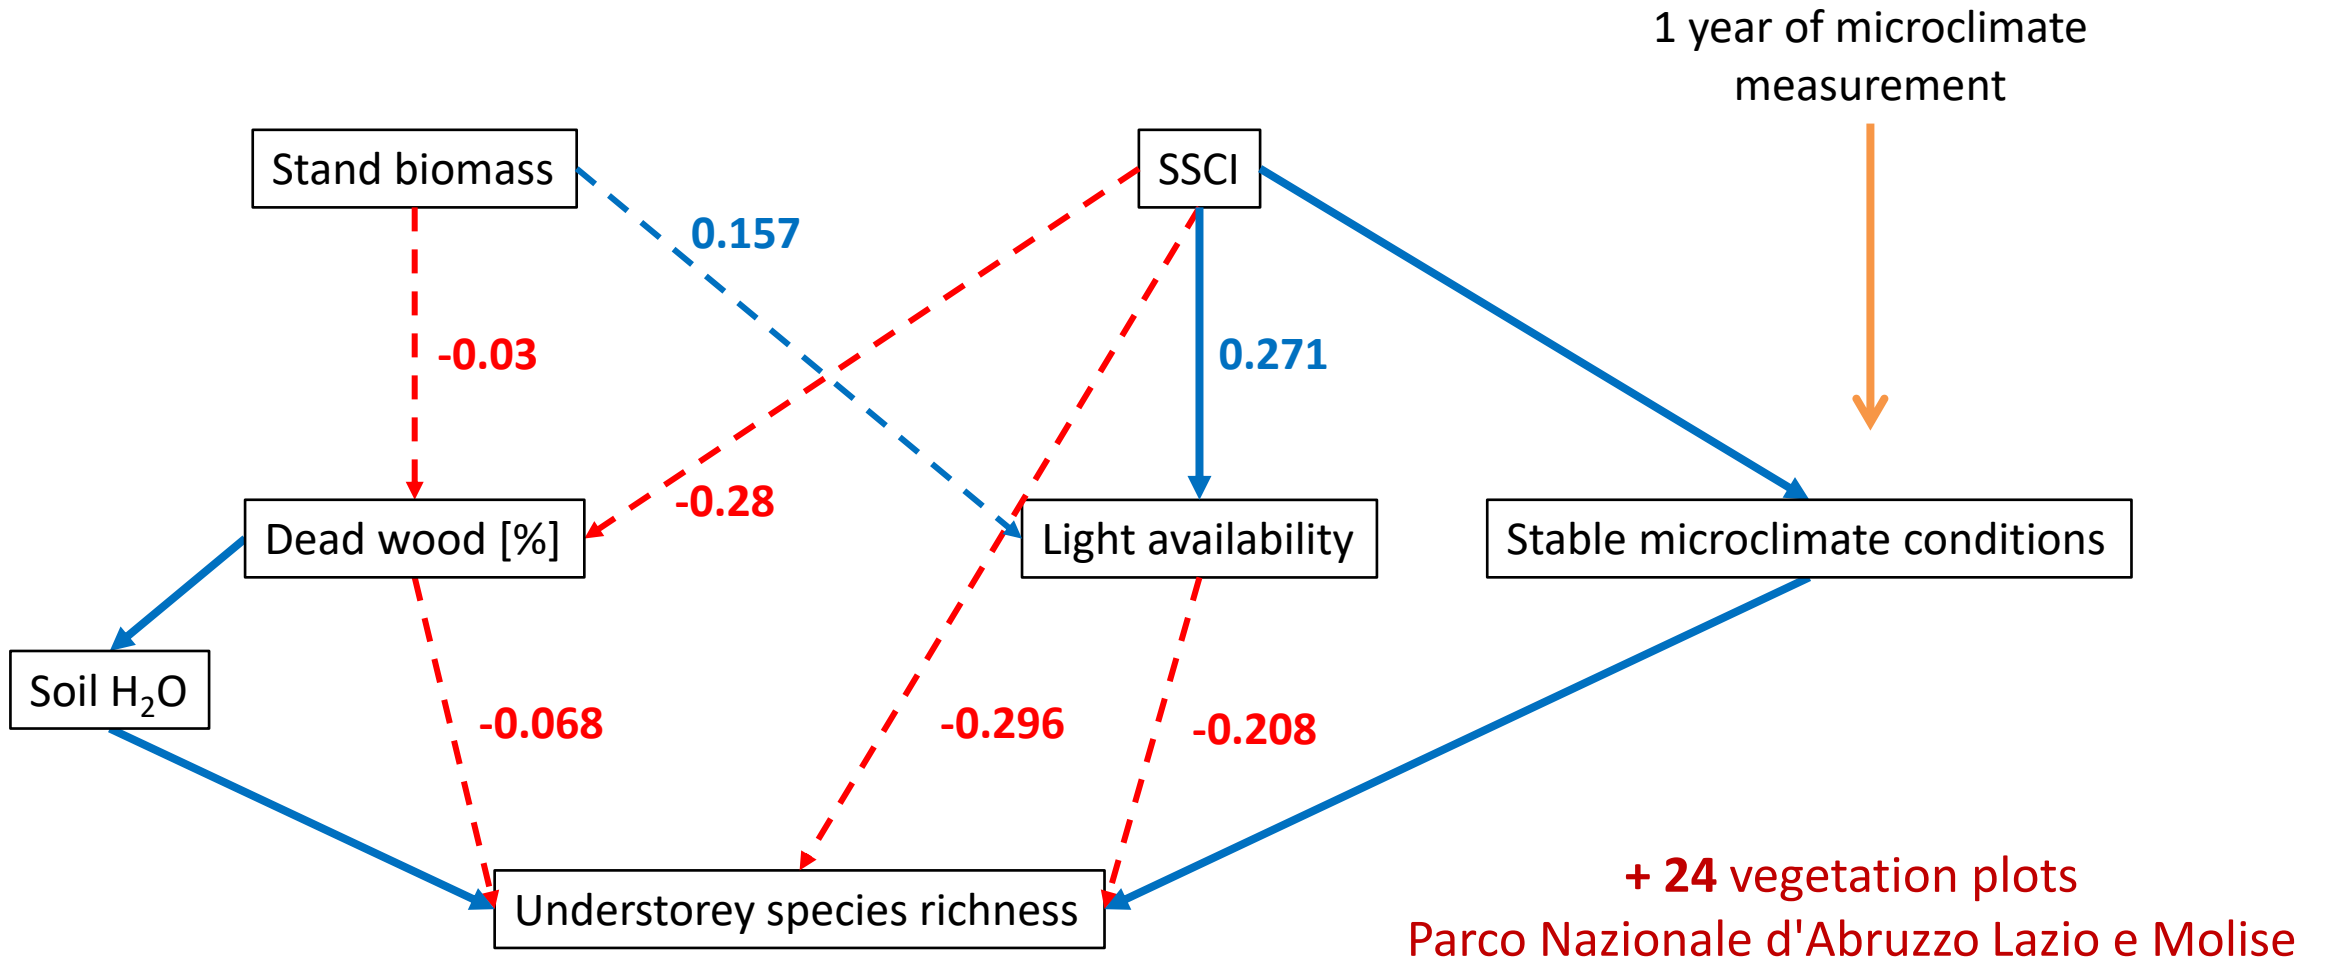

1 year of microclimate
measurement
